

Radiology Core Analysis

GRAPH-TRANFUSE ABLATION ENGINE

PATIENT NAME

Manan Kumawat

DATE & TIME OF GENERATION

13 May 2026 | 23:41 HR

EXAM: MRI BRAIN (AUTOMATED AI VOLUMETRIC ANALYSIS)

CLINICAL INDICATION

Automated segmentation and volumetric characterization of neuroepithelial tissue.

TECHNIQUE

Multi-parametric automated inference performed via Graph-TranFuse neural network.

QUANTITATIVE FINDINGS

- **Peritumoral Edema:** 110.0 mm³
- **Necrotic Core:** 71.0 mm³
- **Enhancing Tumor:** 152.0 mm³ **Total Calculated Lesion Burden:** 333.0 mm³

RADIOLOGICAL IMPRESSION

Automated volumetric analysis reveals a complex lesion demonstrating an active enhancing tumor component (152.0 mm³) with associated peritumoral edema (110.0 mm³) and a necrotic core (71.0 mm³), totaling a lesion burden of 333.0 mm³. The presence of both significant peritumoral edema and central necrosis is indicative of a complex and potentially aggressive pathological process.
